DATE MAILED: 06/12/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

Applicant(s) Application N . 09/835,498 OH ET AL. Offic Action Summary Examiner **Art Unit** 1765 Matthew J Song -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --Peri df r Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status 1)|🛛 Responsive to communication(s) filed on <u>02 June 2003</u>. 2b) This action is non-final. 2a)∏ This action is FINAL. Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213. **Disposition of Claims** 4) ☐ Claim(s) 1-11 is/are pending in the application. 4a) Of the above claim(s) 5-11 is/are withdrawn from consideration. 5) Claim(s) _____ is/are allowed. 6) Claim(s) <u>1-4</u> is/are rejected. 7) Claim(s) _____ is/are objected to. __ are subject to restriction and/or election requirement. 8) Claim(s) ___ **Application Papers** 9) The specification is objected to by the Examiner. 10) The drawing(s) filed on is/are: a) accepted or b) objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a). 11) The proposed drawing correction filed on _____ is: a) approved b) disapproved by the Examiner. If approved, corrected drawings are required in reply to this Office action. 12) The oath or declaration is objected to by the Examiner. Priority under 35 U.S.C. §§ 119 and 120 13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) ☐ All b) ☐ Some * c) ☐ None of: 1. Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received.

2) Notice of Draftsperson's Patent Drawing Review (PTO-948)

3) Information Disclosure Statement(s) (PTO-1449) Paper No(s)

Attachment(s)

14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

a) The translation of the foreign language provisional application has been received.

15) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

4) Interview Summary (PTO-413) Paper No(s).

Notice of Informal Patent Application (PTO-152)

Art Unit: 1765

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1, 3 and 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sivaramakrishnan et al (US 5,879,574) in view of Nishizawa et al (US 6,464,793), Tsuchimoto (US 3,916,034) and Powell et al (US 6,287,643).

Sivaramakrishnan et al discloses a Chemical vapor deposition (CVD) apparatus includes a susceptor 25 installed inside the reactive chamber, a heater/lift assembly 30 and a remote microwave plasma system 55 to deposit plasma enhanced CVD films by inputting deposition reactive gases into system 55 via input line 57 (col 14, ln 20-25). Sivaramakrishnan et al also discloses for plasma processes the CVD apparatus will include a gas feed-through box housing gas passages 83, 85 to enable the application of high voltage RF power to the gas box (col 26, ln 40-45). Sivaramakrishnan et al also discloses a vacuum pump is activated to generate vacuum pressure within a pumping channel, thereby drawing the process gases and plasma residue out of the processing chamber through a exhaust port 361 (col 35, ln 33-37 and Fig 4 and 8), where the exhaust port reads on applicant's gas outlet. Sivaramakrishnan et al also discloses a process selector subroutine 153 identifies the desired set of process parameters needed to operate the process chamber, where the process parameters include process gas composition and flow rates, temperature, pressure, plasma composition and chamber wall temperature (Fig 1D and col 17, ln

Art Unit: 1765

20-35). Sivaramakrishnan et al discloses a process gas control subroutine **163** for controlling the process gas composition and flow rates, which reads on applicant's gas supply controller (col 18, ln 50-67) and heat control subroutine **167** for controlling the temperature (col 19, ln 58-67), which reads on applicant's temperature controller. Sivaramakrishnan et al also teaches a chamber with a ceiling (Fig 1A).

Sivaramakrishnan et al does not disclose at least two gas supply controllers respectively installed at the gas supply pipes to supply the material gases alternately into the chamber.

In a semiconductor crystal growth apparatus, note entire reference, Nishizawa et al teaches a vessel 1 includes nozzles 4 and 5 for introducing gaseous compounds, where the nozzles 4 and 5 are provided with on-off valves 6 and 7 for controlling the introduced amounts of gaseous compounds. Nishizawa et al also teaches a control unit 18 controls the opening and closing of the valves 6 and 7 for alternately and repeatedly introducing gases (col 4-5 and Fig 3). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify Sivaramakrishnan et al with Nishizawa et al to grow an epitaxial layer having a desired thickness can be attained with precision as precise as a single molecular layer (col 4, ln 60-67) and to prevent undesired reactions between two or more source gases.

The combination of Sivaramakrishnan et al and Nishizawa et al does not disclose at least two remote plasma generators installed outside the reactive chamber.

In a method of transporting plasma to a substrate to grow a single crystal of material on a substrate, note entire reference, Tsuchimoto teaches two or more selected materials are turned into separate ionized plasmas in separate plasma generating chambers 1a and 1b (Abstract and Embodiment 2). It would have been obvious to a person of ordinary skill in the art at the time of

Art Unit: 1765

the invention to modify the combination of Sivaramakrishnan et al and Nishizawa et al with Tsuchimoto because a plurality of materials, which cannot coexist in a single plasma generator can be separately turned into the corresponding plasma (col 9, ln 1-67).

The combination of Sivaramakrishnan et al, Nishizawa et al, and Tsuchimoto does not teach one of the gas supply pipes surrounds another of the gas supply pipers, the gas supply pipes being arranged to penetrate the ceiling of the reactive chamber through a common inlet so as to extend to a position above the susceptor.

In an apparatus for injecting atomic species in a plasma reactor, note entire reference, Powell et al teaches a coaxial injector tube comprising an outer tube 72 and an inner tube 84 used for importing gas to a chamber (col 7, ln 55 to col 8, ln 67). Powell et al also teaches the gas tubes penetrate the ceiling of a chamber 86 through a common inlet so as to extend to a position above a susceptor 92 (Fig 5). It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Sivaramakrishnan et al, Nishizawa et al, and Tsuchimoto with Powell's injector tube because concurrent injection increases uniformity of distribution of reactant gas species at a wafers surface (col 8, ln 3-15).

Referring to claim 3, the combination of Sivaramakrishnan et al, Nishizawa et al, Powell et al and Tsuchimoto teaches a heater/lift assembly 30.

Referring to claim 4 the combination of Sivaramakrishnan et al, Nishizawa et al, Powell et al and Tsuchimoto teaches a vacuum pump attached an exhaust port.

Art Unit: 1765

3. Claims 1, 3 and 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sivaramakrishnan et al (US 5,879,574) in view of Nishizawa et al (US 6,464,793), Tsuchimoto (US 3,916,034) and Schmitt et al (US 5,356,672).

The combination of Sivaramakrishnan et al, Nishizawa et al, and Tsuchimoto teach all of the limitations of claim 1, as discussed previously, except the combination of Sivaramakrishnan et al, Nishizawa et al, and Tsuchimoto does not teach one of the gas supply pipes surrounds another of the gas supply pipers, the gas supply pipes being arranged to penetrate the ceiling of the reactive chamber through a common inlet so as to extend to a position above the susceptor.

In a method of depositing a thin film, note entire reference, Schmitt et al teaches a gas jet apparatus 14 configured on a port 16 of a wall of a vacuum chamber 12 and the apparatus is comprised of a preferably cylindrical large nozzle 19 with an interior cavity 20, which receives gas from a reservoir 22. Schmitt et al also teaches a small nozzle 30 is coaxial with the gas jet apparatus receives gas from a reservoir 34 (col 3, ln 60 to col 4, ln 67). Schmitt et al also teaches the gas supply pipes being arranged to penetrate the ceiling 18 of the chamber 12 through a common inlet 16 so as to extend to a position above a susceptor 44 (Fig 1). It would have been obvious to a person of ordinary skill in the art at the time of the invention the combination of Sivaramakrishnan et al, Nishizawa et al, and Tsuchimoto with Schmitt et al's gas jet apparatus because concurrent injection increases uniformity of distribution of reactant gas species at a wafers surface.

4. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sivaramakrishnan et al (US 5,879,574) in view of Nishizawa et al (US 6,464,793), Tsuchimoto (US 3,916,034) and

Art Unit: 1765

Powell et al (US 6,287,643) or Sivaramakrishnan et al (US 5,879,574) in view of Nishizawa et al (US 6,464,793), Tsuchimoto (US 3,916,034) and Schmitt et al (US 5,356,672) as applied to claim 1 above, and further in view of Amano et al (US 5,948,485).

The combination of Sivaramakrishnan et al, Nishizawa et al, Powell et al and

Tsuchimoto or the combination of Sivaramakrishnan et al, Nishizawa et al, Tsuchimoto and

Schmitt et al teaches all of the limitations of claim 2, except a grounding unit connected to the upper container and lower container to clean the inside of the chamber and a RF power generator connected to the susceptor to apply an RF power to the susceptor.

In an apparatus for plasma deposition, Amano et al teaches a plasma process apparatus includes a container 2 divided into two parts, a plasma chamber 21 and a reaction chamber 22, where the vacuum container 2 is grounded at zero potential. Amano et al also teaches aluminum stage 52 for use as a susceptor and the stage is connected with a radio-frequency power supply unit 61 for plasma lead-in through a blocking capacitor. It would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Sivaramakrishnan et al, Nishizawa et al, Powell et al and Tsuchimoto or the combination of Sivaramakrishnan et al, Nishizawa et al, Tsuchimoto and Schmitt et al with Amano's susceptor connected with a radio-frequency power supply because ions are confined to the target object on the susceptor (col 5, ln 1-10). Also it would have been obvious to a person of ordinary skill in the art at the time of the invention to modify the combination of Sivaramakrishnan et al, Nishizawa et al, Powell et al and Tsuchimoto or the combination of Sivaramakrishnan et al, Nishizawa et al, Tsuchimoto and Schmitt et al with Amano's grounded container because it protects the

Art Unit: 1765

integrity of the chamber and the chamber circuitry from any static discharge or induced electrical currents that may build in or on the chamber.

Response to Arguments

5. Applicant's arguments filed 6/2/2003 have been fully considered but they are not persuasive.

Applicant's argument that Sivaramakrishnan et al nor Adams et al teach a reactive chamber having an upper and a lower container junctioned by an O ring has been considered but has not been found persuasive. The limitation of a reactive chamber having an upper and a lower container junctioned by an O ring has been deleted from claim 1 in Amendment B filed on 5/12/2003 and does not require consideration.

6. Applicant's arguments with respect to claims 1-4 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Solomon et al (US 6,179,913) teaches a compound nozzle 33, where an outlet 34b is completely encircled by an outlet 32b and the outlet 34b is coaxial with outlet 32b (col 4, ln 55-67 and Figs 2-4).

8. Any inquiry concerning this communication or earlier communications from the examiner

should be directed to Matthew J Song whose telephone number is 703-305-4953. The examiner

can normally be reached on M-F 9:00-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Benjamin L Utech can be reached on 703-308-3868. The fax phone numbers for the

organization where this application or proceeding is assigned are 703-872-9310 for regular

communications and 703-872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding

should be directed to the receptionist whose telephone number is 703-308-0661.
